Introduction

This document details C-Pro Direct labelling of Medical Device products

Definitions:

Product Packaging: Product Packaging for Medical Device products will always have an MDR compliant label attached at the time of manufacture. Product Packaging may be a sealed carton, poly bag or bubble wrap bag depending on the item.

Product Carton: Is a further level of packaging beyond Product Packaging used to store one or a multiple number of products. Product Cartons are used where necessary to facilitate transportation and storage

Despatch Label (formally called Stock Label): This label is applied to Product Packaging and / or Product Cartons as part of the despatch process (106_PRO). In addition to basic product identification data Despatch labels also carry details of the customer order and order references for each order line item. Despatch may therefore only be applied at despatch time in the context of a specific sales order. Despatch labels are generated using Bartender Software which reads from the Sage accounting system database.

Shipping Carton: Is the outermost carton, bag, envelope used for transportation of the products to their destination. The courier's Courier Waybill is applied to the Shipping Carton.

Wasp label: Is a label generated by the C-Pro Direct stock control system. The Wasp label is machine readable and carries Item, Lot and Date Code (expiry date) information

GS1 Data Matrix: Is a two dimensional barcode format used for Medical Device labelling. GS1 Data Matrix labels enable multiple data items (e.g., Unique Device Identification data and Production Information – UDI-PI) to be encoded and read by devices with GS1 Matrix Parsing capability.

Code 128 (Linear barcode): Is a one dimensional barcode format that is machine readable and used on medical device labelling

**Product Packaging
Medical Device Labelling**

Standard format used for most C-Pro Direct products (100mm x 50mm)

Label attached to Product Packaging

Main label attached to packaging
